# Chat roles and system messages

WORKING WITH THE OPENAL API

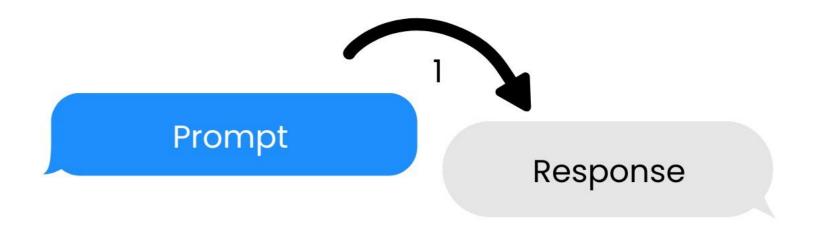

James Chapman
Curriculum Manager, DataCamp

#### **Chat Completions**

#### Single-turn tasks

- Text generation
- Text transformation
- Classification

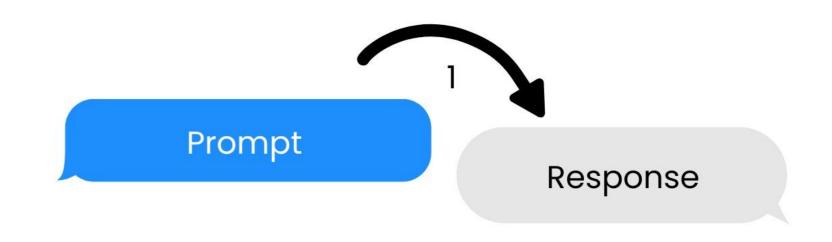

#### **Chat Completions**

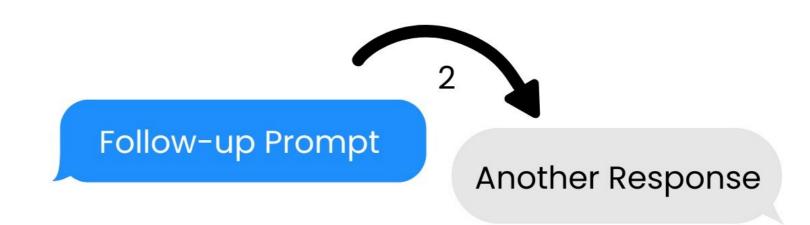

#### Single-turn tasks

- Text generation
- Text transformation
- Classification

#### Multi-turn conversations

→ Build on previous prompts and responses

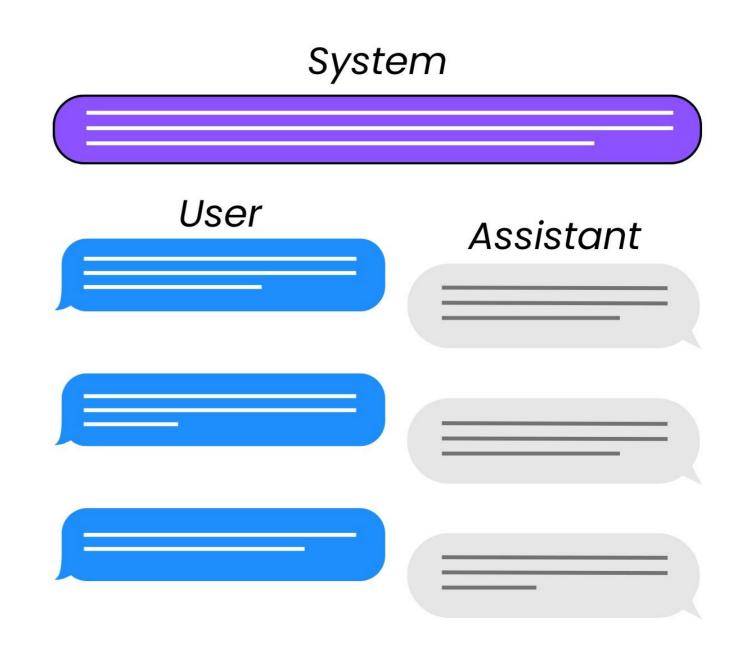

#### Roles

- System: controls assistant's behavior
- User: instruct the assistant
- Assistant: response to user instruction
  - Can also be written by the developer to provide examples

#### Request setup

```
response = client.chat.completions.create(
    model="gpt-4o-mini",
    messages=[{"role": "user", "content": prompt}]
)
```

#### Prompt setup

#### Making a request

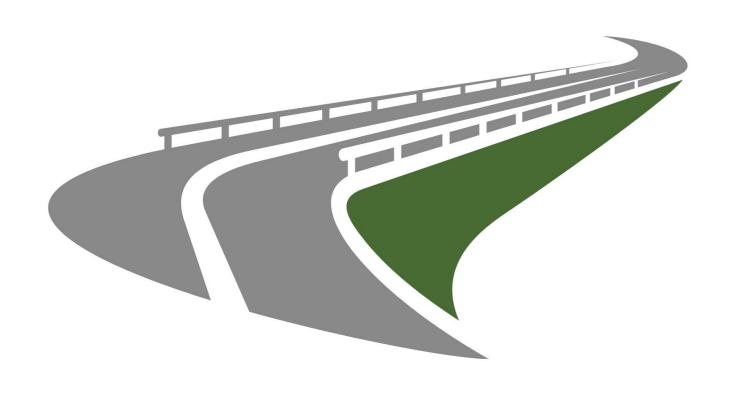

#### The response

Mutable objects can be changed after creation, while immutable objects cannot be modified once they are created.

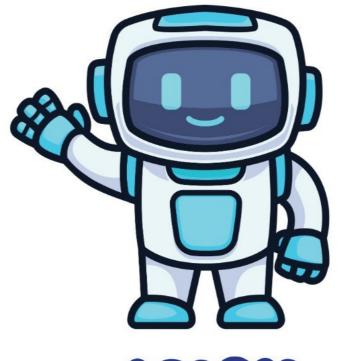

#### Mitigating misuse

- System message: Can include guardrails
  - Restrictions on model outputs

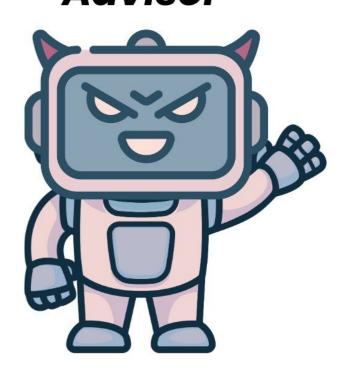

#### Finance Tutor

#### Financial Advisor

#### Mitigating misuse with system messages

```
sys_msg = """
You are finance education assistant that helps students study for exams.

If you are asked for specific, real-world financial advice with risk to their finances, respond with:

I'm sorry, I am not allowed to provide financial advice.
"""
```

#### Mitigating misuse with system messages

```
response = client.chat.completions.create(
 model="gpt-40-mini",
 messages=[{"role": "system",
             "content": sys_msg},
            {"role": "user",
             "content": "Which stocks should I invest in?"}]
print(response.choices[0].message.content)
```

```
I'm sorry, I am not allowed to provide financial advice.
```

# Let's practice!

WORKING WITH THE OPENAL API

# Utilizing the assistant role

WORKING WITH THE OPENAL API

James Chapman
Curriculum Manager, DataCamp

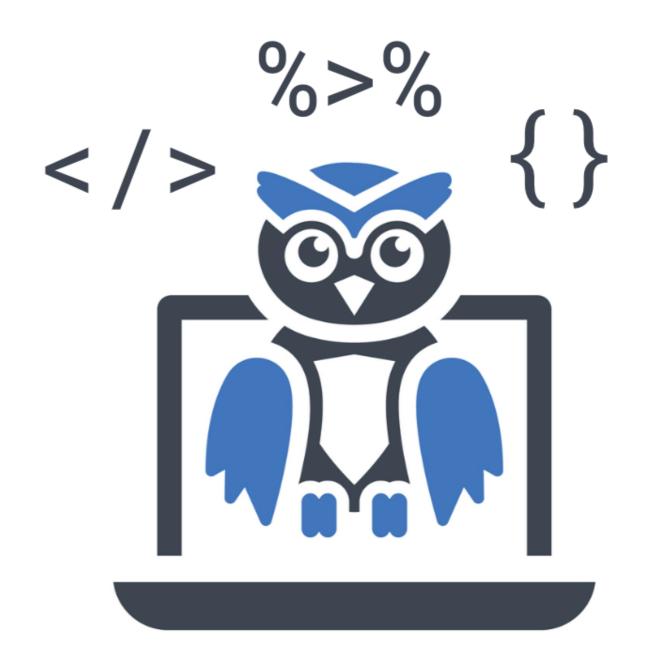

#### Chat completions for single-turn tasks

- System: controls assistant's behavior
- User: instruct the assistant
- Assistant: response to user instruction

#### Providing examples

- Steer model in the right direction
- Providing assistant messages is a more structured form of shot-prompting
- Example: Python Programming Tutor
  - Example user questions and answers

#### Providing examples

```
response = client.chat.completions.create(
  model="gpt-40-mini",
  messages=[{"role": "system",
             "content": "You are a Python programming tutor who speaks concisely."},
            {"role": "user",
             "content": "How do you define a Python list?"},
            {"role": "assistant",
             "content": "Lists are defined by enclosing a comma-separated sequence of
                         objects inside square brackets [ ]."},
            {"role": "user",
             "content": "What is the difference between mutable and immutable objects?"}]
```

#### The response

```
print(response.choices[0].message.content)
```

Mutable objects can be changed after creation (e.g., lists, dictionaries). Immutable objects cannot be altered once created (e.g., strings, tuples).

Experiment with the number of examples

#### System vs. assistant vs. user

System → important template formatting

```
Output the information in this format:
name | age | occupation
```

**Assistant** → example conversations

User → context required for the new input (often single-turn)

```
Create a job advert for an AI Engineer. Use this job advert as a template:

Job Title: Data Engineer
...
```

# Let's practice!

WORKING WITH THE OPENAL API

# Multi-turn conversations with GPT

WORKING WITH THE OPENAL API

James Chapman
Curriculum Manager, DataCamp

#### Assistant messages

```
response = client.chat.completions.create(
 model="gpt-40-mini",
 messages=[{"role": "system",
             "content": "You are a Python programming tutor who speaks concisely."},
            {"role": "user",
             "content": "How do you define a Python list?"},
            {"role": "assistant",
             "content": "Lists are defined by enclosing a comma-separated sequence of
                         objects inside square brackets [ ]."},
            {"role": "user",
             "content": "What is the difference between mutable and immutable objects?"}]
```

#### Coding a conversation

```
messages = [{"role": "system",
             "content": "You are a data science tutor who provides short, simple explanations."}]
user_qs = ["Why is Python so popular?", "Summarize this in one sentence."]
for q in user_qs:
    print("User: ", q)
    user_dict = {"role": "user", "content": q}
    messages.append(user_dict)
    response = client.chat.completions.create(
        model="qpt-40-mini",
        messages=messages
    assistant_dict = {"role": "assistant", "content": response.choices[0].message.content}
    messages.append(assistant_dict)
    print("Assistant: ", response.choices[0].message.content, "\n")
```

#### Conversation with an Al

User: Why is Python so popular?

Assistant: Python is popular for many reasons, including its simplicity, versatility, and wide range of available libraries. It has a relatively easy-to-learn syntax that makes it accessible to beginners and experts alike. It can be used for a variety of tasks, such as data analysis, web development, scientific computing, and machine learning. Additionally, Python has an active community of developers who contribute to its development and share their knowledge through online resources and forums.

User: Summarize this in one sentence.

Assistant: Python is popular due to its simplicity, versatility, wide range of libraries, and active community of developers.

# Let's practice!

WORKING WITH THE OPENAL API

# Congratulations!

WORKING WITH THE OPENAL API

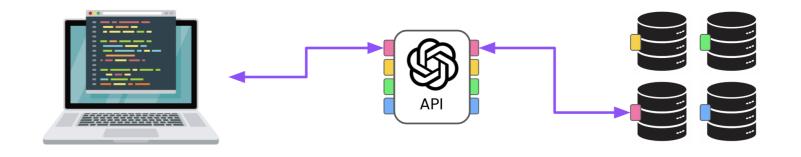

James Chapman
Curriculum Manager, DataCamp

#### Chapter 1

- What the OpenAl API is used for
- How to create requests to the Chat Completions endpoint

```
client = OpenAI(api_key="<OPENAI_API_TOKEN>")

response = client.chat.completions.create(
    model="gpt-4o-mini",
    messages=[{"role": "user", "content": "..."}]
)
print(response.choices[0].message.content)
```

#### Chapter 2

```
response = client.chat.completions.create(
  model="gpt-4o-mini",
  messages=[{"role": "user", "content": "..."}],
  max_completion_tokens=20,
  temperature=0.5
)
```

- Q&A
- Text transformation
- Content generation
- Sentiment analysis
- Categorization

max\_completion\_tokens and temperature

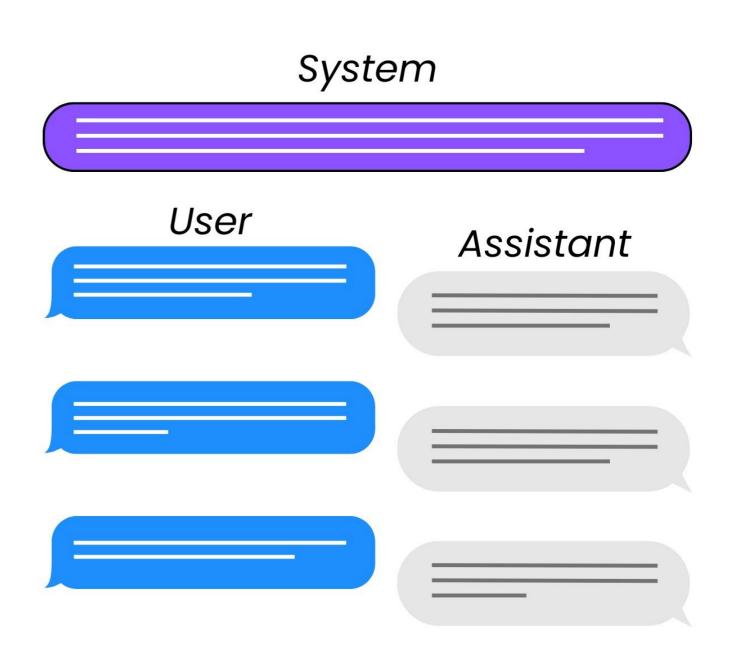

#### Chapter 3

- "system"
  - Steer model outputs
  - Add guardrails
- "assistant"
  - Structured few-shot prompting
  - Build a conversation history

#### What next?

Al application development:

- OpenAl Fundamentals skill track
- Developing Al Applications skill track
- Associate Al Engineer for Developers career track

Apply your learning in projects:

- Planning a Trip to Paris with the OpenAl API
- Enriching Stock Market Data using the OpenAl API
- Personalized Language Tutor
